

Psychoeducational Reevaluation Report

SYNTHETIC DEVELOPMENT RECORD — NOT A REAL STUDENT

Student Information

Student:	Jordan Lee
Date of Birth:	2015-10-21
Grade:	5
School:	Synthetic Elementary School
District:	Synthetic District
Evaluation Date:	2026-03-04
Evaluator:	School psychologist

Reason for Reevaluation

Jordan is being reevaluated as part of the required review of special education eligibility and educational need. The reevaluation question for Jordan Lee is difficulty following lengthy spoken directions across different settings. This psychoeducational reevaluation provides cognitive and task-performance context. It is not a substitute for a speech-language review and does not assign IEP services.

Sources of Information

Information available to the evaluator on the evaluation date includes the reevaluation plan, review of educational records, teacher description of classroom performance, parent information, and direct observation during individual testing.

- Reevaluation plan dated 2026-02-03
- Review of existing educational records
- Teacher information from Ms. Green
- Parent information regarding homework
- Student observation during individual testing

Attention and Task Performance

Individual testing was completed in a quiet room with Jordan and the evaluator. The session included oral directions of varying length, brief written items, and structured reasoning tasks. Nearby sentences in this section describe related but distinct observations and must not be treated as interchangeable evidence.

During individual testing, Jordan asked for one direction to be repeated on four of twelve multistep tasks.

On a separate vocabulary item, Jordan asked for a single word to be repeated after a cough in the hallway. That request is not the multistep-direction count recorded above.

When directions were presented one step at a time, Jordan began tasks without additional prompting.

When directions were presented all at once, Jordan paused before beginning several items.

Jordan requested a pencil during one written item. Asking for a material is not the same observation as requesting that a direction be repeated.

Teacher and Parent Information

Classroom and home descriptions were collected as reported statements. They are not evaluator observations of school performance and they are not interchangeable with one another.

Ms. Green reported that Jordan usually completes independent classwork when written directions remain visible.

Ms. Green also noted that Jordan participates cooperatively during short, familiar routines. Cooperative participation is not evidence that lengthy spoken directions are already easy in every setting.

Jordan's parent reported that homework involving several spoken directions often requires two or three reminders.

The parent report is limited to homework involving several spoken directions. It does not state that Jordan requires two or three prompts during school independent work, and it is not an evaluator conclusion.

Cognitive / Processing Context

Structured reasoning tasks were administered to provide context for educational planning. This section records observed performance. It does not assign a medical or clinical diagnosis.

Performance was less consistent on tasks requiring Jordan to hold and manipulate several pieces of verbal information at once.

Less consistent performance on those items is described as it was observed. This report does not identify a working-memory disorder, ADHD, or an executive-function disorder for Jordan.

Overall reasoning performance fell within the expected range for Jordan's age.

Age-expected reasoning is not a finding that lengthy spoken directions are already easy across classroom settings. The two observations answer different questions.

Near the end of the session, Jordan completed the visual puzzles with

steady effort and no request for additional time. That closing observation is not a direction-following measurement and is not used as Gold evidence.

Educational Interpretation

During individual testing, Jordan asked for one direction to be repeated on four of twelve multistep tasks. When directions were presented one step at a time, Jordan began tasks without additional prompting. Performance was less consistent on tasks requiring Jordan to hold and manipulate several pieces of verbal information at once. Overall reasoning performance fell within the expected range for Jordan's age. Teacher and parent reports describe setting-specific difficulty with lengthy spoken directions.

The pattern is setting- and format-specific. Individual testing, classroom written support, and homework with several spoken directions are different contexts. They should not be collapsed into a single global statement that the student cannot follow directions.

Recommendations

Recommendations include breaking lengthy verbal directions into shorter steps and checking understanding before independent work begins.

These recommendations are evaluation suggestions. They are not evidence that the current IEP already provides those classroom strategies, and they are not a determination of special education eligibility.

Recommendations include breaking lengthy verbal directions into shorter steps and checking understanding before independent work begins.

This report does not determine special education eligibility and does not assign IEP services or annual goals.
