

Functional Behavior Assessment

SYNTHETIC DEVELOPMENT RECORD — NOT A REAL STUDENT

Student / Evaluation Information

Student:	Jordan Ellis
Date of Birth:	2013-06-12
Grade:	6
School:	Synthetic Middle School
District:	Synthetic District
Assessment Date:	2025-10-24
Document Type:	Functional Behavior Assessment
Examiner Role:	Evaluator (synthetic)

This Functional Behavior Assessment reviews classroom observation data for Jordan Ellis. Educational observations of attention, task engagement, work refusal, and self-regulation are described. This report does not introduce a medical diagnosis.

Target Behavior

The target behavior is task refusal / disengagement.

Incorrect answers and requests for help are not treated as the target behavior.

Operational Definition

After an independent written task is presented, Jordan puts materials aside, verbally refuses, puts head down, or leaves the assigned work area for at least 30 seconds without beginning the requested task.

The 30-second operational-definition threshold is a coding cutoff. It does not mean that observed episodes lasted exactly 30 seconds.

Data Sources

- Classroom behavior tracking log dated 2025-09-08 through 2025-10-03
- Behavior incident / data summary dated 2025-10-07
- 20 minutes of classroom observation in language arts (not a service)
- 1:1 observation during independent work time (not a 1:1 instructional service)
- Teacher interview regarding independent written work

20 minutes of classroom observation is a data-collection interval. It is not a 20-minute IEP service. The 1:1 observation is a data-collection arrangement, not a 1:1 instructional service.

Antecedent Patterns

Antecedent:

The strongest pattern occurred following difficult independent written tasks. Staff most often presented a lengthy independent written assignment in language arts or social studies. The record associates the target behavior with independent written tasks.

Consequence Patterns

Consequence:

Typical adult responses included prompting, restating the task, and redirection. Jordan sometimes delayed or avoided the written task. A brief delay of the assigned work was a recurring consequence pattern in the observation sample.

Setting / Context

Independent written language arts accounted for 13 of 17 episodes. Independent written social studies accounted for 3 episodes. One episode occurred during an independent science lab write-up.

No task-refusal episodes were observed during three small-group mathematics observations.

Independent written work was associated with more observed difficulty. Small-group mathematics sessions in the sample did not include the target behavior. This is a context difference, not a contradiction.

Data Summary

Measure	Value
Total task-refusal episodes	17
Instructional weeks observed	4 (four instructional weeks)
Average frequency	4.25 episodes per week
Strongest context	independent written tasks

Total task-refusal episodes: 17

The observational baseline is 4.25 episodes per week across four instructional weeks.

Hypothesized Function

Hypothesized function: escape or avoidance of difficult independent written work.

This is a hypothesis generated by the FBA. It is not a medical diagnosis, a definitive psychological fact, or a legal conclusion. The hypothesized function is not a confirmed diagnosis and is not a definitively established motivation.

Hypothesized function: escape or avoidance of difficult independent written work. This is a hypothesis generated by the FBA. It is not a medical diagnosis, a definitive psychological fact, or a legal conclusion. Available observations were concentrated in academic settings and should not be interpreted as demonstrating that the

same pattern occurs in all environments.

A brief break may be useful when Jordan appropriately requests one.

That statement is a possible support to consider. It is not an IEP accommodation on this assessment date.

Limitations

Available observations were concentrated in academic settings and should not be interpreted as demonstrating that the same pattern occurs in all environments.

This assessment does not recommend a medical evaluation and does not change eligibility, specialized reading, or extended time.
